Please join us for a presentation to launch the **Data Inventory for Healthy Aging Research in Newfoundland and Labrador**, a project funded under the NL Healthy Aging Research Program (NL-HARP) in 2013.

The Research and Evaluation Department of the Newfoundland and Labrador Centre for Health Information is conducting an inventory of data sources relevant to healthy aging in this province so that aging researchers can gain a better understanding of the nature, scope and quality of the various data sources available to them. The meeting on November 27th will involve a presentation by the principal investigator of the project, Dr. John Knight, Senior Epidemiologist. After the presentation, Dr. Knight will engage members of the Research Exchange Group on Aging in a discussion of available data holdings, data needs, and perceived gaps in available data. Input will also be sought on additional organizational or individual contacts to include in the data inventory.

This project has important implications for research on healthy aging in Newfoundland and Labrador. We urge researchers, students, and anyone with an interest in supporting research on healthy aging to attend.
